

Canine Core Vaccine Results: 2023-2024

Below are histograms indicating the distribution of canine serum sample titers from January 1st, 2023, to present day. Values to the right of the vertical black line are considered to be titer levels sufficient for protection in cases of normal exposure. Figure 1

Figure 1.

A comparison of the percentage of samples designated as NOT-protective during 2021-2022 and 2023-present is presented below. Figure 2

Figure 2.

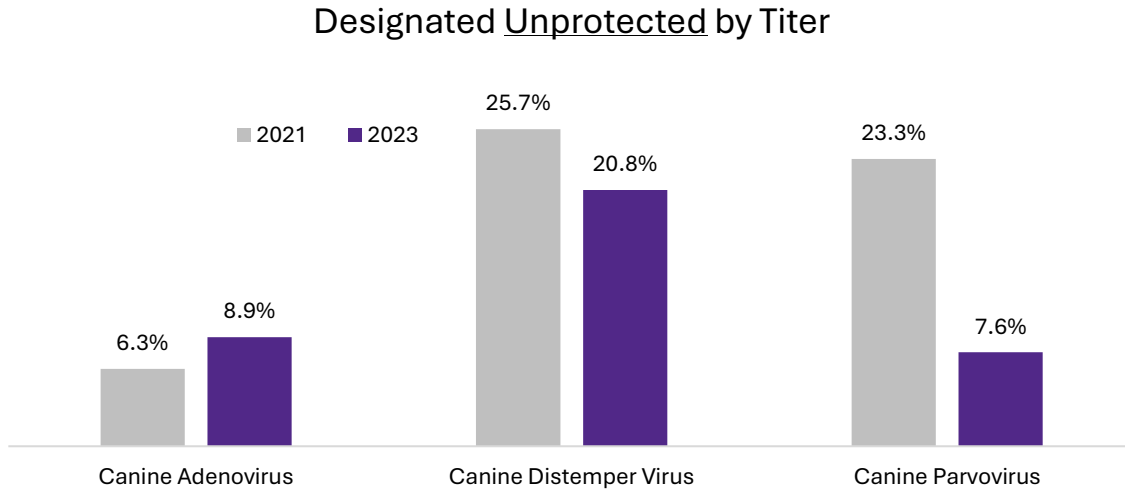

Figure 3 below is a histogram of the feline serum sample titer testing.

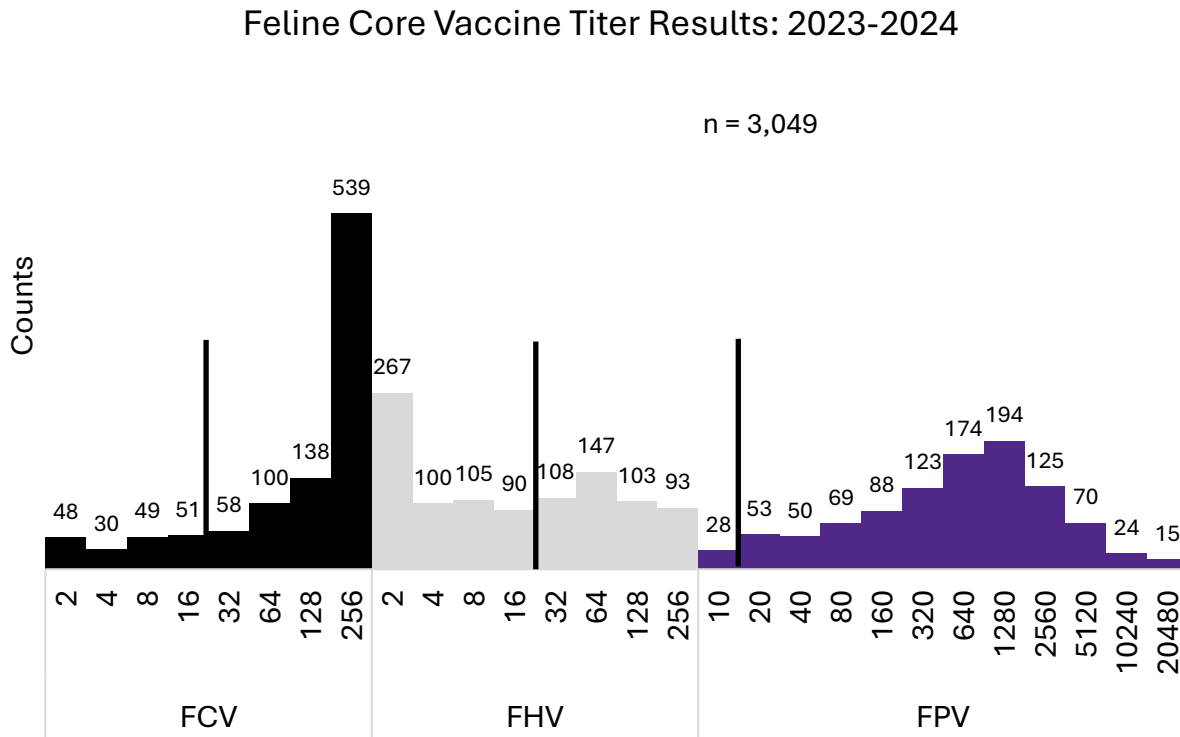

Figure 4 indicates the percentage of serum samples designated as NOT protective. This trend indicates a larger percentage of feline samples were NOT protective compared to the previous two years. Are felines not being vaccinated as before? Were the levels in 2021-2022 a result of COVID?
